

Task: Implementing a Cloths list Application with CRUD operations with custom hook and dynamic form.

- Create a FormData components, the form contains input fields like Cloth Name, Cloth Id, Price, Quantity, Description, a select menu that contains three colors as options like "red","blue","green" , add terms and condition with checkbox, add date field Manufacture date and add three radio button of Size "M", "L" and "XL".
- When submit the form data it should be stored in local-storage.
- There should be another component called ClothTable that contain the ClothRow component.
- ClothRow contains the info of cloths in a table row data.
- Integrate user interactions to add, delete and data should be stored in local-storage.
- All type of form validation should be applied like can't take empty value, can't take take cloths that over max quantity, can't take negative value .
- Optional task: Make a custom hook named useForm for form data
